## How to set up the Rating Service Project?

The CodingNijas team developed the Rating Service as an example for our students. The rating service is very similar to an outside service we frequently encounter, such as a payment method on an e-commerce website or a review site like Google.

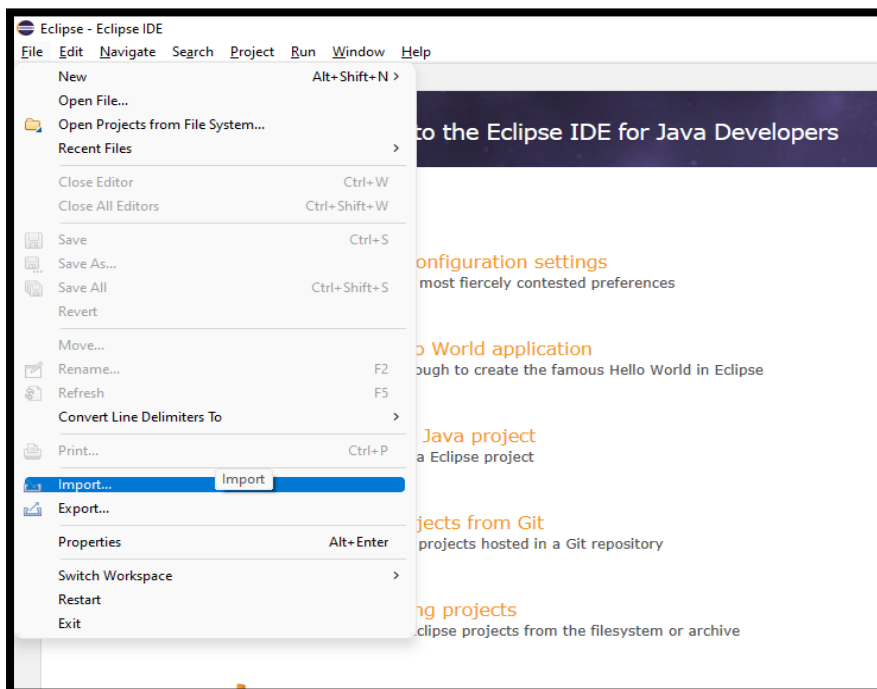

Similarly, we'll use the Rating Service application in our hotel project to comprehend how different web applications leverage external APIs in their work. Download the Rating Service project into your Eclipse IDE and practice with the instructor in future videos for a better understanding.

**Let's go over these processes in more detail using illustrations.**

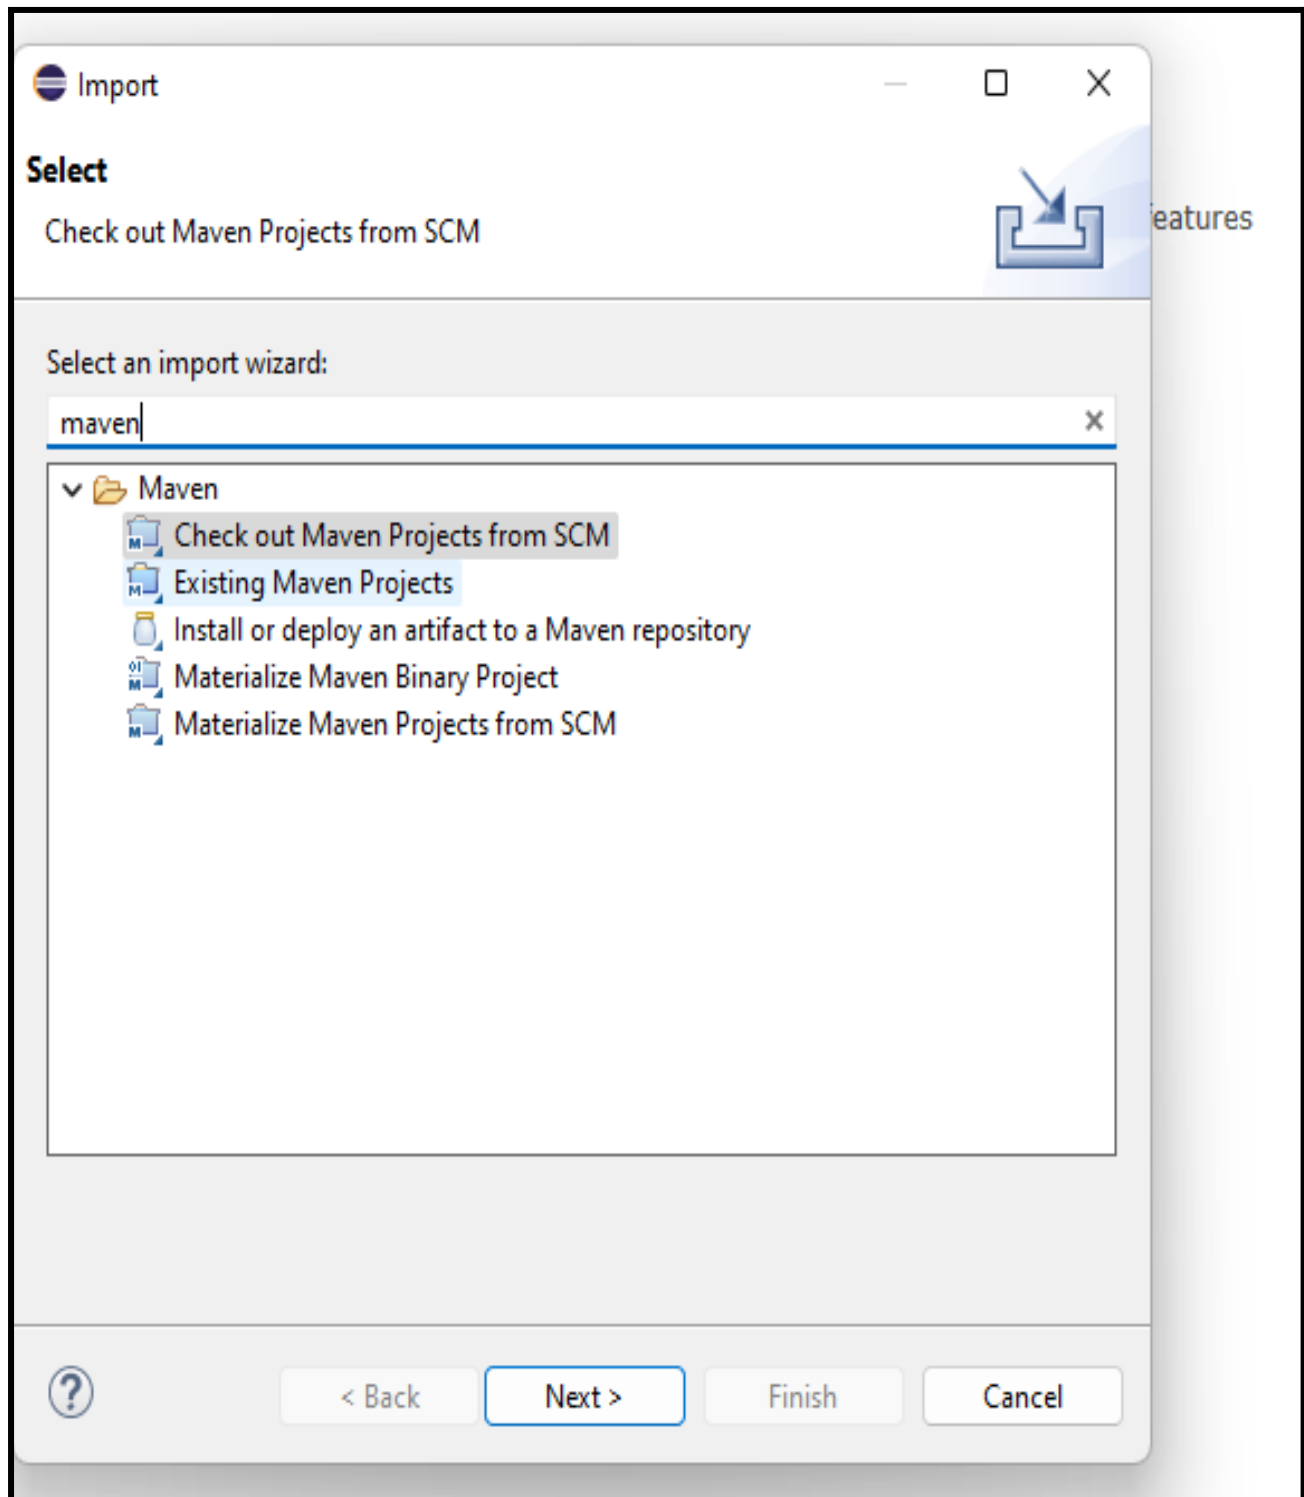

**Step 1:** Click on the [Link](#) to download the rating Service application in your local system.

Install the Eclipse IDE by referring to this article on how to install the Eclipse IDE for enterprise Java and web development.

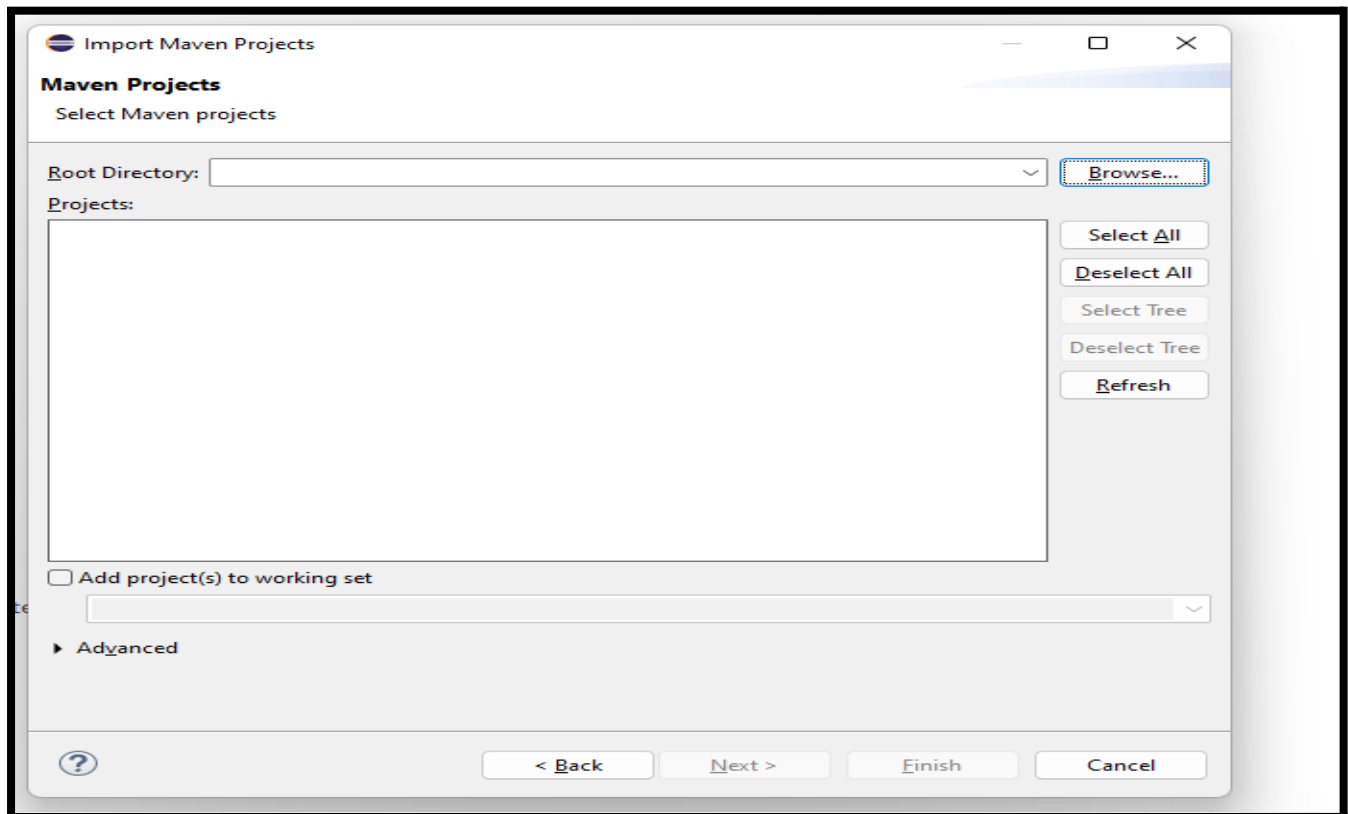

**Step 2:** Open your Eclipse IDE and go to **File > Import**, as shown in the below image.

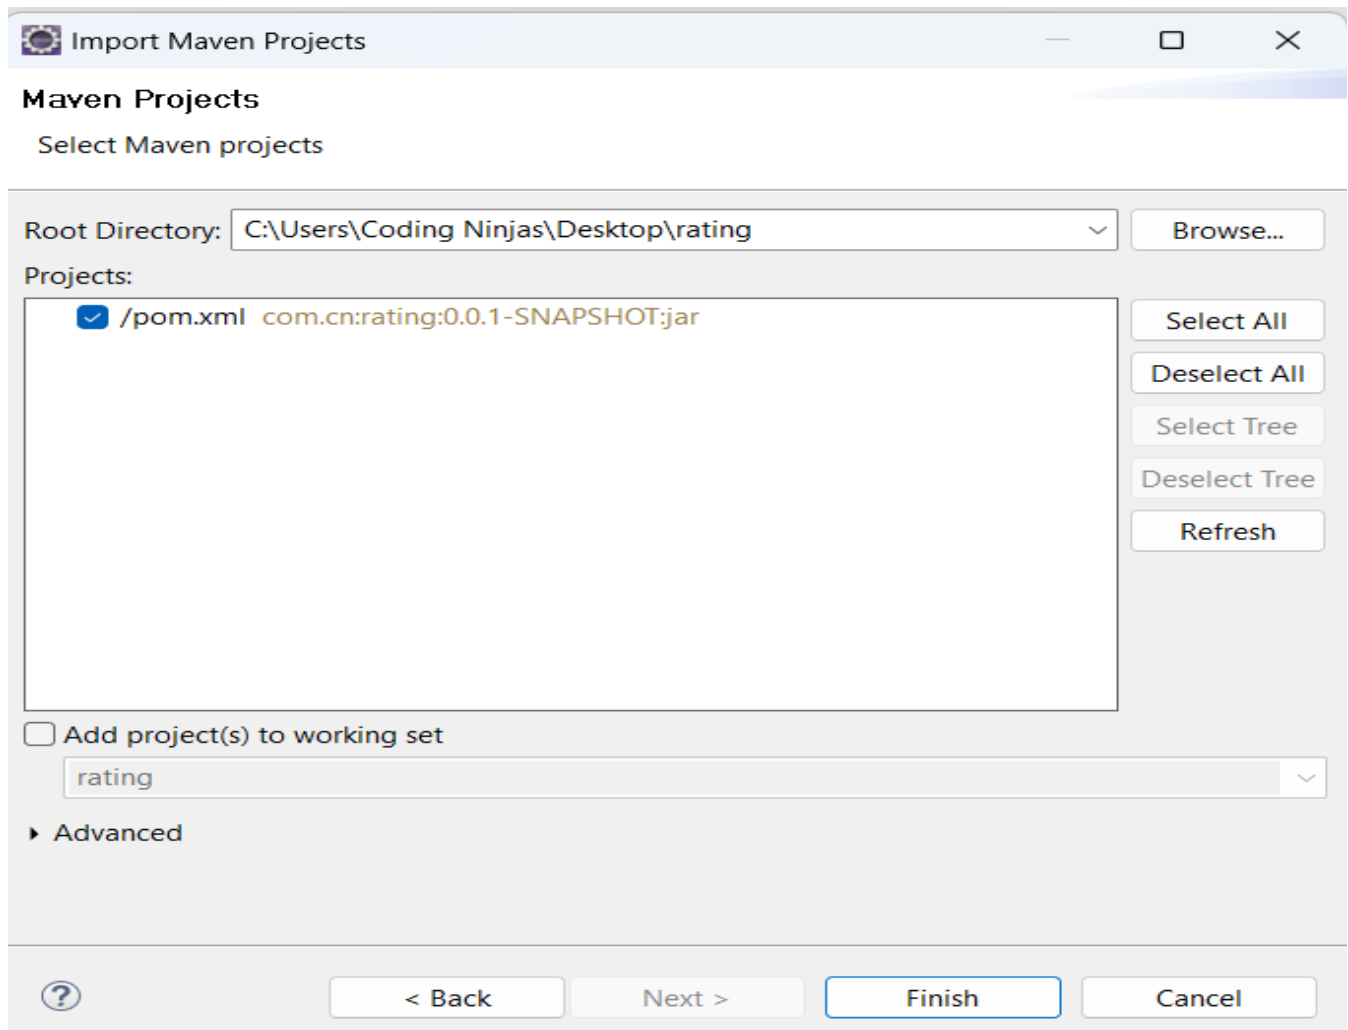

**Step 3:** As seen in the figure below, type "maven" into the search box, select Existing Maven Project, and click the Next button.

**Step 4:** Locate and select the extracted “**rating.zip**” folder created by clicking on the Browse option.

**Step 5.** Finally, click the Finish button to complete the Spring Boot project creation.

The screenshot below shows that the Spring Boot project is ready.
